**\* N.B.:** The data for 2015 above are only very early results, as of May, 2015. The known outcomes reported here will increase substantially by December.

Prior to the most recent two years, the data in this table are based *entirely* on student self-reporting through survey. Now, they are based on surveying, as well as using public domain sources (e.g., LinkedIn, Facebook, etc.). This has added substantially to our eventual "knowledge rate" regarding first year outcomes of Vassar graduates. Reporting of multiple activities was permitted through the class of 2005, in 2009, and again in 2012. Thus, activities sum to greater than 100% in these years. However, multiple responses have not been permitted otherwise. Thus, these year-to-year changes in the data themselves result in some incompatibility in the trends as presented above and in the graph below. The primary effect is that each outcomes *appears* to decline from 2005 to 2006, and most *appear* to rise from 2011 to 2012. However, much of the apparent changes in outcomes (2005 to 2006, and 2011 to 2012) are only an artifact of the nature of the data collected year to year.

This survey was not conducted in 2010-11, i.e., for the Class of 2010. Also, the data for 2011 represent outcomes fully 15 months post-graduation.

Finally, the 2012 survey was not fully compatible with those in earlier years, particularly as regards graduate and professional school outcomes.
